                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                C-delta-1 polypeptide (AAW00876) is the chick homologue of Drosophila Delta, a protein that binds to Notch protein. Expression of C-Delta-1 correlates with onset of neurogenesis. The C-delta-1 amino acid sequence was deduced from a cDNA clone (AAT58898) obtd. from chick stage 4-6 embryos. A shorter version (AAW58877) of C-Delta-1, lacking the 12 C-terminal amino acids of the longer version, was also isolated, and mouse (AAW11720) and human (AAW11721-38) Delta-1 polypeptides have been identified. Delta-1 proteins can be used to treat or prevent disorders characterised by increased Notch activity, such as cervical, breast, lung or colon cancer, melanoma or seminoma, and nervous system disorders or to promote tissue regeneration and repair

                                                                  Delta, a protein that binds to Notch protein. Expression of C-Delta-1 correlates with onset of neurogenesis. The C-delta-1 amino acid sequence was deduced from a cDNA clone (AAT58897) obtd. from chick stage 4-6 embryos. An alternatively spliced variant (AAW00876) was also isolated, and mouse (AAW11720) and human (AAW11721-38) Delta-1 polypeptides have been identified. Delta-1 proteins can be used to treat or prevent disorders characterised by increased Notch activity, such as cervical, breast, lung or colon cancer, melanoma or seminoma, and nervous system disorders or to promote tissue regeneration and repair

New cleavage peptide, nucleic acids and antibodies useful for diagnosis, prevention and treatment of cancer, disorders of central nervous system, cirrhosis and psoriasis

Claim 1; Fig 3; 177pp; English.

This sequence represents the chick delta protein amino acid sequence.

Delta is a toporythmic protein that contains a sequence which is cleaved by the metalloprotease-distintigrin (Kuzbanian (Kuz). Cleavage by Kuz results in two fragments, a soluble amino terminal fragment consisting essentially of the extracellular domain, and a membrane bound fragment consisting essentially of the extracellular domain, and a membrane bound fragment consisting essentially of the extracellular domain. The consisting of the transmembrane domain and the intreactallular domain. The soluble fragment is able to bind to Notch. Delta plays a key role in differentiation, and therefore detection and measurement of delta activation is important in the study of differentiation. The invention relates to the delta cleavage peptides (the activation belta cleavage peptides to methods for detecting and measuring delta activation. Delta cleavage peptides of methods for detecting and measuring delta activation. Delta cleavage peptides or an clear protein are useful for medulating the activity of modulated and vice versa. A delta cleavage peptide or its derivative capable of binding kuz protein is useful for treating or preventing a disease or disorder associated with increased delta activity or expression such as cervical, breast, colon or lung cancer, melanoma or seminoma in humans. A recombinant cell comprising a delta peptide is useful for the diagnosis of diseases or disorders associated with increased levels of Nocch-delta protein bind kuz protein. A complex, colon or lung cancer, melanoma activity comprising measuring the ability of delta cleavage peptide is useful for the diagnosis of diseases or disorders associated with aberrant levels of the complex, comprising measuring the ability of delta cleavage peptide is useful for the presence of, or predisposition to complex, comprising measuring the ability of delta cleavage peptide is associated with aberrant levels of complex, complex, complex, complex, keloid formation, psortsais, baldness

                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a polypeptide which suppresses proliferation and differentiation of undifferentiated cells such as neurons and blood cells. The polypeptide may be used for the prevention and control of disorders involving undifferentiated cells, such as leukaemia and malignant tumours, and improvement of blood formation, after immunosuppression
                                                                                                                                                                                                                                                                                                  NGKNCSTPVSRCEHNPCHNGATCHERSNRYVCECARGYGGLNCQFLLPEPPQGPVIVDFT

The protein or fragments, especially PW75495, can be used as a drug to control vascular cells. The se were isolated and the truncated fragments were generated using primers AAX16818-X16831

                                                                                                                                                                                              The present invention describes full length and shortened human delt proteins. Human delta-2 is a differentiation inhibitor which inhibit differentiation of undifferentiated cells (other than brain or musc] cells), such as blood cells, and enhances the proliferation of undifferentiated blood cells. Products of human delta-2 may be used the treatment of diseases such as leukaemia and malignant tumours. I may also be used in the culture of human cells in vitro, e.g. for production of supplies of undifferentiated blood cells. The present sequence represents human delta-1, from an example of the present

The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, overlanding architis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sjogren's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems, hepatobiliary diseases of the central and peripheral nervous systems, hepatobiliary diseases, inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune or immune-mediated skin diseases, allergic diseases, immunological disease, peripheral nand graft-versus-host-diseases. AACS83878 cepresent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AACS879 to AACS8578 cepresent human PRO polynucleotide and protein sequences given in the ceremplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180

The present invention describes nucleic acids encoding PRO polypeptides
useful for preventing, diagnosing and treating diagnosing a
cardiovascular, endothelial or angiogenic disorder in mammals by
modulating cell proliferation, angiogenesis and cardiovascularisation,
and for identifying agonists and antagonists of these processes. The
reatment and diagnosis of diseases associated with inappropriate PRO
expression such as cardiovascular, endothelial or angiogenic disorders in
mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For
example, the nucleic acids (NCs) and vectors containing them and the PRO
polypeptide may be used to treat disorders associated with decreased PRO
expression. AAA77510 to AAA77721 and AAB24388 to AAB24435 represent
nucleotide and protein sequences used in the exemplification of the
s encoding PRO polypeptides useful for preventing, diagnosing diagnosing a cardiovascular, endothelial or angiogenic mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                               ~

                                                                                                          ð
                                                                                                                                         Isolated PRO211, PRO228, PRO538, PRO172 or PRO182 polypeptides or their agonists (preferably anti-PRO agonist antibody or a small molecule mimicking the biological activity of PRO polypeptide) are useful in vitro or in vivo for inhibiting the growth of a tumour cell. Compositions comprising the PRO polypeptides are useful for inhibiting neoplastic cell growth and for treating cancer including breast, ovarian, renal, cancer, melanoma and leukaemia in a mammal. The PRO polypeptides are also useful for treating other disorders such as neuronal, glial, astrocytal, hypothalamic and other glandular, macrophagal, epithelial, stromal, blastocoelic disorders and inflammatory, angiogenic and immunologic disorders as well as being useful for identifying agonists to PRO polypeptides by contacting the polypeptide with a candidate molecule and conitoring biological activity mediated by the polypeptide

                                                                                                                                                                             ð
                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                     AAU12172-AAU1246 represent novel human secretory and transmembrane PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides, to link bioactive molecules to cells expressing PRO polypeptides, to link bioactive molecules to cells expressing PRO polypeptides, and to detect the presence of mammalian lung, colon, breast, prostate, rectal, cervical or liver tumours by comparing PRO polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation of proteoglycans from cartilage, the printer ear utricular supporting cells or of T-prophocytes, the release of proteoglycans from cartilage, the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polymucleotides encoding PRO polypeptides can be used to generate probes, antisense RNA/DNA, transgenic or knock out animals and can be used in gene therapy

The invention relates to novel human angiogenesis-associated proteins designated PRO proteins (AAB53064-B53097), and to nucleic acide encoding PRO proteins also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, agoniere or antagoniere of a PRO protein, agoniere or antagoniere of a PRO protein, adoniere acid, the recombinant production of a PRO protein, agoniere or antagoniere of a PRO protein, adoniere or antagoniere of a PRO protein, additionally encompasses methods of identifying modulators of PRO additionally encompasses methods of identifying modulators of PRO expression or activity; diagnosing a cardiovascular, endothelial or angiogenic disorder, or a susceptibility to such a disorder by detecting mutations in a PRO gene, or the expression level of a PRO gene within a particular tissue; treating a cardiovascular, endothelial or angiogenic disorder via the administration of a PRO protein, PRO nucleic acid; and methods of inhibiting or stimulating endothelial acid, and methods of inhibiting or stimulating endothelial acidies. PRO protein, or an agonist pRO proteins, PRO nucleic acids, PRO proteins, antibodies agints PRO proteins, endothelial or angiogenic disorders, such as atheracelerosis, osteoporosis, myocardial infarction, hypertension, alabetic retinopathy, rheumatoid arthritis, Crohn's disease, psoriasis, endometriosis, ulcers, wounds, cancer, Alzheimer's disease, psoriasis, endometriosis, ulcers, wounds, cancer, Alzheimer's disease, or stroke. PRO proteins, as hybridisation probes to screen libraries to isolate obnas with sequence identity to PRO proteins, and in gene therapy. PRO nucleic acids can also be used to produce transgenic animals useful for the development and secreening of potential independence rep
                                                                                                                                                                                                                    lyzing
angioge

The invention describes an isolated nucleic acid (I) comprising, or which has 80 % sequence identity to, or the full-length coding sequence of, one of 275 nucleotide sequences, and which encodes a corresponding polypeptide selected from 275 amino acid sequences, where all sequences are given in the specification. The polypeptide encoded by (I) is used to detect PRO polypeptides, link a bioactive molecule to a cell expressing a PRO polypeptide, modulate a biological activity of a cell, stimulate the release of tumour necrosis factor (TNF)-alpha from human blood, modulate the proliferation or differentiation of cells or gene expression, stimulate the release of proteoglycans, stimulate the release of cytokine from peripheral blood mononuclear cells, inhibit the binding of A-peptide from peripheral blood mononuclear cells, inhibit the binding of A-peptide acid and polypeptide encoded by it, are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome (AIDS), cancer, or diabetic complications. The nucleic acid is useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. This is the amino acid sequence of a novel human secreted and

The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the treatment of diabetes, bone and/or cartilage a medicament c useful in the treatment of diabetes, bone and/or cartilage disorders (e.g. rheumatoid arthritis, sports injuries, osteoarthritis), obesity, hypor- or hypo-insulinaemia, hearing loss, and coagulation disorders (e.g. stroke, heart attack). Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABU80870-ABU81144 represent the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web site at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    173
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3

The present invention relates to the isolation of novel human PRO
polypeptides, and the polynucleotide sequences encoding them. The PRO
polypeptides are secreted and transmembrane proteins. The PRO
polypeptides are useful for detecting other PRO polypeptides, for linking
to polypeptides are useful for detecting other PRO polypeptides, for modulating
to bioactive molecules to cells expressing PRO polypeptides, for modulating
to biological activities of cells expressing PRO polypeptides, and for for
identifying agonists or antagonists. The PRO polypeptides are useful for
thuman blood, for stimulating the prosence of tumours. The polynucleotide
thuman blood, for stimulating the presence of tumours. The polynucleotide
chondrocytes, and detecting the presence of tumours. The polynucleotide
to chondrocytes, and detecting the genetic analysis of individuals with
the preparation of PRO polypeptides, for generating transgenic
animals or knockout animals, for the genetic analysis of individuals with
genetic disorders, and in gene therapy. ABU66570-ABU66844 represent the
thuman PRO polypeptides of the invention. Note: The sequence data for this
patent was obtained in electronic format directly from the USPTO web site
at sequata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                         New secreted and transmembrane PRO nucleic acids, useful for gene therapy, in chromosome and gene mapping, as chromosome markers, in tissue typing, and in chromosome identification.
                                                                                                                                                                                                                                                          Gao
